Learning Management System (LMS)

Revolutionize Learning about your Data & HDMS Product Solutions

SmartHealthData.com is a user-friendly Learning Management System (LMS). As part of our blended learning approach, this Online Training Center works in conjunction with our live classroom and webinar training events to better connect you with a variety training resources.

The self-paced courses are designed to let you control your own knowledge and development. You choose what, when and where you want to learn… as all courses, related materials and documents are available 24/7.

Top 10 Benefits

Administrative Perspective

1. Streamlined training process
Using an LMS to manage blended learning will improve and streamline your training administration process, allowing you to plan your training activities calendar and share it with your learners, trainers and co-administrators. A LMS also allows you to easily track the progress of your learners individually on a recurring basis, which is a time consuming and resource exhaustive task when done manually. Overall, it centralizes training functions and reduces your time and cost expenditures.

2. Ability to have more engaging training options
Different people learn in different ways, with most being able to retain only 10% of what they hear. However, the learning and retention gets incrementally better with the addition of a new sense. This means, a training program that offers a new approach is bound to have a greater success rate. And blended learning program carried out via an LMS allows for this to happen.

Choosing the right blend will help you break the monotony of a classroom session and the impersonal-ness of online learning. By pulling in formal and informal learning channels together, you can increase communication and collaborative learning not just amongst your learners but also between learners and trainers.

3. Scalability and wider reach
By utilizing SmartHealthData.com, training is not limited to the seating capacity of a classroom. Learners can be engaged, irrespective of their location. Live classroom training programs
can be a great benefit when utilized in certain circumstances, but eLearning courses can
be delivered to wide audiences spread across different geographies, without affecting the consistency and quality of the training.

4. Easy and secure exchange of learning data
The LMS' secure system and robust server, facilitates uploading, storing and sharing of learning resources in the form of courses, assessments, documents and manuals that complement your blended learning program. These online resources serve as a repository for learners to access information when needed during self-paced learning or as performance-support tools during a face-to-face learning session.

Features

• Easy-to-use navigation

• Available on PC and many popular mobile devices

• Ability to update your Profile

• Searchable Course Catalog where you can review and add available courses.

• On Demand, unlimited access to complimentary and premium courses.

• Available program materials (handouts, user guides, etc.) linked to a program

• Full listing of currently enrolled in courses and ability to re-take a course at any time

• Test your knowledge with exams at course completion (when applicable)

• Provide feedback assessment at the end of a course to enhance future training opportunities

• Personalized transcript that allows you to track your learning development

• One-click access to the HDMS Knowledge Center

• Comprehensive document library that will include HDMS documentation, including user manuals, training guides, and handouts on topics like Linking Methodology and Reporting Periods and Run-out Status.

• Printable certificates for course completions

• Reporting available to track student activity for a client

• Opportunity to create a branded portal for your specific company (additional cost)

• Customizable learning maps and courses for different users

Learning Management System (LMS)

5. Technology leverage

With digitization of the work processes and workplaces, today almost every employee is equipped with a desktop or laptop and a mobile phone at work. This entails a ready opportunity to leverage the existing technology at hand for learning without spending surplus budget.

For Learners

6. Flexible access to training resources

Training isn't limited by time restrictions and will become a continuous process, available as and when needed by the learner. Apart from attending face-to-face training session or user forums, learners can continue acquiring and exchanging additional knowledge over the LMS through access to training resources.

7. Multiple learning channels and multiple media formats

Learners can access a variety of learning elements in different media formats, like eLearning courses, demonstrations, videos by product specialists on the LMS and documents. This serves as a knowledge repository for a large amount of information which when accessed can provide an effective and engaging learning experience for your learners, which is not usually possible in simple, white board training approaches.

8. Reduced dependency

Missing face-to-face learning session will not mean loss of crucial information for learners while using an LMS. They can access learning resources and even recording of the session later via an LMS. Thus, learners are not completely dependent on one source of information, but can access it from the LMS whenever they need it. This also encourages self-paced learning amongst the learners and increases knowledge retention as it is acquired at their own level of comfort.

9. Train when you are on the go

While face-to-face training brings in a personal touch to the training process, online training allows a learner access to training even on the go. SmartHealthData.com is accessible through many smart phones so learning is not limited to the traditional classroom or office.

10. Tracking learner progress and compliance

A few short clicks can show the learner what has been accomplished in the past. They can choose to retake courses or exams as needed and to demonstrate knowledge by printing course certifications.

Our LMS provides learning on:

Enlight
Data Analysis Reporting Tool
Provides historical, current, and predictive views of health data for decision making

CareShield
Evidence-Based Medicine Analysis
Measures plan performance against industry standards

Episodes
Episodes of Care Analysis
Gets to the heart of the data story of your members' episodes of care using episode related dimensions and measures

Methodologies
Enriched Analytics
40+ methodologies that are available to analyze your data, including: SDoH, NYU ER, and Predictive Models

Scheduler
Scheduled Reporting
Delivers key performance metrics automatically on a scheduled basis

Health Data & Management Solutions (HDMS) is a CVS Health company that transforms health data into a critical resource for building better health and health opportunities.
